Star Wars™

If I had any
REAL brains
would I be doing this?

I hope that I don't
short out any
of his circuits.

What is Intelligence?

- ◆ Who knows what it is
- ◆ Ability to understand or reason (dictionary)
- ◆ Mental ability: learning, problem solving, abstract thinking, & reasoning (encyclopaedia)
- ◆ Herb Simon
 - ◆ Involves associations, pattern recognition, inference, experience, & intuition
- ◆ 1948 Conference

What does “Artificial” mean?

- ◆ Random House College Dictionary:
 - ◆ Produced by man
 - ◆ Made in imitation or as a substitute
 - ◆ Simulated
- ◆ Examples
 - ◆ Artificial Chocolate
 - ◆ May look and taste like chocolate, but it's not
 - ◆ Hot dogs
 - ◆ Soy dogs look like hot dogs, kind of taste like them, are definitely healthier, but contain no meat.

Then what is Artificial Intelligence?

- ◆ Combining the terms
 - ◆ Simulated ability to understand, reason, and problem solve,
 - ◆ or at least appear to
- ◆ Ability of a computer to perform tasks (that human intelligence is capable of doing) such as reasoning and learning. (McGraw-Hill computer Handbook)

What are we Trying to Accomplish?

- ◆ Solve problems
- ◆ Improve performance
- ◆ Increase profits
- ◆ Forecasting
- ◆ Better decisions
 - ◆ DSS – Decision Support Systems
- ◆ Model biological to further understanding

Example applications

- ◆ Mycin
 - ◆ Expert system that helps doctors to diagnose infectious blood diseases
- ◆ Teresius
 - ◆ Expert system to help with investments
- ◆ Microsoft Office™
 - ◆ Uses AI to help correct mistakes
 - ◆ To do what it thinks is best
- ◆ My work in forecasting CD rates
 - ◆ Neural network time series forecasting

Current AI Methods

- ◆ Expert Systems
- ◆ Case Based Reasoning
- ◆ Neural Networks
- ◆ Genetic Algorithms
- ◆ Fuzzy logic
- ◆ Data Mining
- ◆ Hybrid
- ◆ Synthetic Immune Systems

Expert Systems

- ◆ Just like having a subject expert
- ◆ The same as a Decision Tree
- ◆ Stored in a set of “If.. then..” rules
- ◆ Consists of
 - ◆ Rule base
 - ◆ Inference engine/rule interpreter
- ◆ Get rules from Human Expert
- ◆ Knowledge engineer converts knowledge into rules
- ◆ Example
 - ◆ If this is a corner, then must go into second gear

Using an Expert System

◆ Steps

- ◆ Hire an expert
- ◆ Hire a knowledge engineer
- ◆ Create rule set
- ◆ Apply problem

◆ Limitations

- ◆ Can only answer problems that it has already seen
- ◆ Contains biases of expert
- ◆ Where is the intelligence?

Case Based Reasoning

- ◆ Very similar to our legal system
- ◆ Store a large selection of cases
- ◆ Lookup engine
- ◆ Find case like problem at hand
- ◆ Example
 - ◆ The last time the car would not go it was a plugged fuel filter

Applying CBR

- ◆ Must have library of cases
- ◆ Inference engine is hard to create, looking for similarities between problem and database of cases
- ◆ Cannot solve anything that was not in the original database
- ◆ Where is the intelligence?

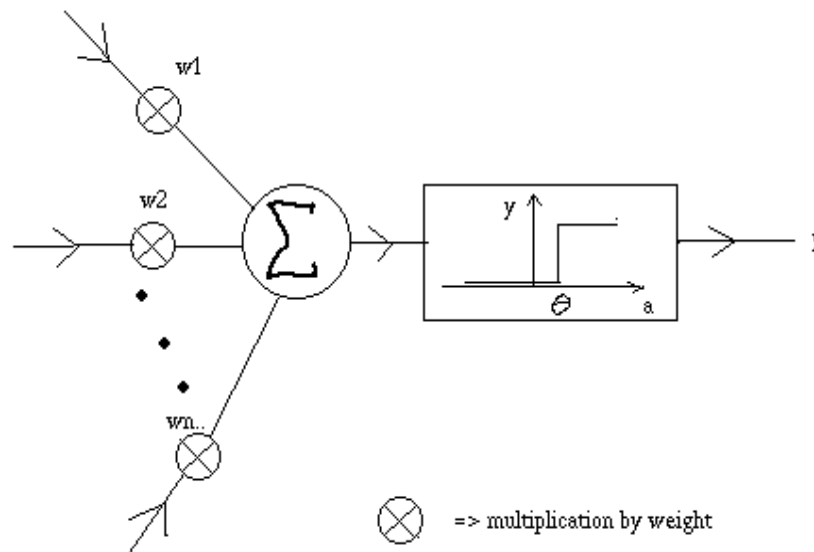

Neural Networks

- ◆ What is a neural network?
- ◆ Biological
- ◆ Computer emulation (ANN)
- ◆ Massively parallel system
- ◆ General data driven function approximator
- ◆ Functions performed
 - ◆ Pattern recognition
 - ◆ Classification
 - ◆ Forecasting/nonlinear regression
 - ◆ Brain emulation

Feed Forward Neural Network

Model of Individual Neuron

Input is a large number of weighted outputs from nerves or other neurons
It sums the weighted inputs
If the sum is greater than a threshold, then it fires

Using Neural Networks

◆ Steps

- ◆ Get training data set
- ◆ Optional clean the data
- ◆ Set ANN architecture
- ◆ Train the system

◆ Weaknesses

- ◆ Operator designs architecture and sets training
- ◆ Very operator dependent

◆ Where is the intelligence?

Genetic Algorithms (GA)

- ◆ John Holland and Schema Theorem, 1975
- ◆ Imitates natural evolution
 - ◆ Also called evolutionary computing
 - ◆ Modeled on natural selection
 - ◆ Survival of the fittest
- ◆ Exploited search in hyperspace (N space)
- ◆ Near optimal solution for complex problems

How GA's Work

- ◆ Start with initial population of chromosomes
 - ◆ Each one represents a possible solution
 - ◆ Chromosome is a string of binary values
- ◆ Mate with each other to produce new chromosomes, mutation included
- ◆ Test all chromosomes
- ◆ Rate them (figure of merit)
- ◆ Kill off worst solutions
- ◆ Mate again and start all over
- ◆ Stop by 3 criteria
 - ◆ No more improvement
 - ◆ Number of generations
 - ◆ Achieved desired level of performance

Using a Genetic Algorithm

- ◆ Must make fitness function
 - ◆ Dependent on criteria being searched
 - ◆ Rates fitness of each chromosome
- ◆ Give it initial population
- ◆ Watch out for local maxima/minima
- ◆ Can be used to find best or worst
 - ◆ Depends on fitness function
- ◆ Large overhead
- ◆ Where is the intelligence?

Fuzzy Logic

- ◆ Lotfi Zadeh, 1968
- ◆ Originally developed for “specificity” to help communicate
- ◆ To convert lingual variables into computer inputs
 - ◆ Hot, cold, high, medium, low, too much, etc
- ◆ Is there any intelligence here?
- ◆ Now Fuzzy Logic Type II Jerry Mendel
- ◆ Precisiated Natural Language

Data Mining

- ◆ Tons of data available today
- ◆ Look into the data
 - ◆ No preconceived ideas
 - ◆ Look and see what you find
 - ◆ Look for patterns
- ◆ Today, people search data for specific things
- ◆ Heavily operator dependent
- ◆ Try statistics first, then SVM or PSVM. Also cluster analysis, neural networks, other search methods
 - ◆ SVM is Support Vector Machine
 - ◆ PSVM is polynomial SVM
 - ◆ Methods to group observations upon dimensions
- ◆ Where is the intelligence?

A decorative spiral binding at the top of the slide, consisting of a series of grey, metallic-looking rings.

Synthetic Immune Systems

- ◆ Mimics human autoimmune system
- ◆ Good for computer security
 - ◆ Detects intrusions
- ◆ Somewhat a reverse cluster analysis
 - ◆ Detects if not in acceptable cluster
- ◆ Uses statistics, clustering, pattern recognition, etc
- ◆ Where is the intelligence?

Hybrids

- ◆ Combinations of the methods
- ◆ My work
 - ◆ Neural network
 - ◆ Linked list database
 - ◆ Fuzzy logic on some inputs
 - ◆ Genetic algorithms to set architecture & weights
- ◆ Biological intelligence is truly a combination of methods

Future

- ◆ Systems that
 - ◆ set themselves up
 - ◆ learn from successes and mistakes
 - ◆ learn from the environment
 - ◆ Behave like biological intelligence
- ◆ Autonomous learning
- ◆ Driving factors:
 - ◆ Security
 - ◆ Anti terrorism
 - ◆ “Big Brother”
 - ◆ Business
 - ◆ Every facet including marketing

Some Applications

- ◆ Computer Security
 - ◆ Who to let in
 - ◆ Acceptable activity
 - ◆ Virus detection
- ◆ Detection
 - ◆ Sniper in tree
 - ◆ Submarine in under water
- ◆ Classification
 - ◆ Credit approval
 - ◆ Credit card transaction approval

More Applications

- ◆ Pattern recognition
 - ◆ Guidance system
 - ◆ Iris Scans
 - ◆ Retina scans
 - ◆ Finger prints
 - ◆ Criminal activity
 - ◆ Purchasing patterns
 - ◆ Voice recognition
 - ◆ Character recognition
- ◆ Forecasting
 - ◆ Stock prices or other financial data
 - ◆ Tracker for radar/sonar
 - ◆ Non-linear regression

Even More Applications

- ◆ Optimization
 - ◆ Traveling salesman problem
 - ◆ Complex scheduling problem
 - ◆ Setting weights and architecture of ANN
- ◆ Bio-medical
 - ◆ Seizure prediction
 - ◆ Model brain
 - ◆ Condition recognition
 - ◆ Diagnosis support
